Mergers and acquisitions (M&As) are events that attract considerable interest from academics and practitioners, and much research has been conducted into their impact on individuals, organizations and societies. Yet, despite all the existing research and the varied theoretical and methodological approaches employed, there remains more to learn about M&As. The Routledge Companion to Mergers and Acquisitions takes a detailed look at this multifaceted subject using a novel framework of four domains – substantive issues, contextual issues, methodological issues and conceptual issues. Drawing on the expertise of its international team of contributors, the volume surveys the state of the field, including emerging and cutting-edge areas such as social network analysis and corporate branding. This Companion will be a rich resource for students, researchers and practitioners involved in the study of M&As, and organizational and strategic studies more widely.

This two-volume handbook on current best-practices in quantitative methods as practiced in the social, behavioral, and educational sciences covers philosophical and ethical issues, theory construction, model building and types of models, survey and experiment design, measurement issues, observational methods, statistical methods, types of analysis, types of data, and common research fallacies.

In today ' s complex and interconnected world, scholars of international relations seek to better understand challenges spurred by intensified global communication and interaction. The complex connectedness of modern society and politics compels us to investigate the pattern of interconnections among actors who inhabit social and political spaces. Gabriella Pa á r-J á kli's study aims to advance theory and practice by examining the networks used by specialists in North America and Europe to achieve their policy goals in the area of science and technology. Her book suggests that to overcome policy problems transnationally, three critical factors should be considered. First, as science and technology policy becomes increasingly critical to resolving global issues, it should be regarded as an integral element of the foreign policy process. Second, as liberal international relations theory argues, the increasing role of NGOs must be taken seriously alongside states as vital agents of policy reform. Third, as transatlantic relations remain center to maintaining the global order, they must be reconsidered. Paar-Jakli assesses the role of digital networks as facilitators of regional cooperation. Utilizing various techniques of social network analysis, her research indicates an active and structurally discernible network in cyberspace among transatlantic organizations, and demonstrates the role of virtual networks as facilitators of cooperative arrangements in transatlantic relations. Pa á r-J á kli's original research uses social network analysis to investigate transatlantic cooperation, a new approach that will be noteworthy to network and transatlantic scholars as well as policymakers.

Ideas about social structure and social networks are very old. People have always believed that biological and social links among individuals are important. But it wasn't until the early 1930s that systematic research that explored the patterning of social ties linking individuals emerged. And it emerged, not once, but several times in several different social science fields and in several places. This book reviews these developments and explores the social processes that wove all these "schools" of network analysis together into a single coherent approach.

The Third Edition of this best-selling text has been fully revised and updated to include coverage of the many developments on social network analysis (SNA) over the last decade. Written in a clear and accessible style, the book introduces these topics to newcomers and non-specialists and gives sufficient detail for more advanced users of social network analysis. Throughout the book, key ideas are discussed in relation to the principal software programs available for SNA. The book provides a comprehensive overview of the field, outlining both its theoretical basis and its key techniques. Drawing from the core ideas of points, lines and paths, John Scott builds a framework of network analysis that covers such measures as density, centrality, clustering, centralisation, and spatialisation. He identifies the various types of clique, component, and circle into which networks are formed, and he outlines an approach to socially structured positions within networks. A completely new chapter in this edition discusses recent work on network dynamics and methods for studying change over time. A final chapter discusses approaches to network visualisation. This is an excellent resource for researchers across the social sciences and for students of social theory and research methods.
