Sturm-Liouville Theory. In 1836 and 1837, Sturm and Liouville published a series of papers on second order linear ordinary differential operators, which began the subject now known as the Sturm–Liouville theory. In 1910, Hermann Weyl published an article which started the study of singular Sturm–Liouville problems.

In 1836-1837 Sturm and Liouville published a series of papers on second order linear ordinary differential equations including boundary value problems. The influence of their work was such that this subject became known as Sturm-Liouville theory. The impact of these papers went well beyond their subject matter to gen

AMS Chelsea Publishing: An Imprint of the American Mathematical Society. The spectral theory of Sturm-Liouville operators is a classical domain of analysis, comprising a wide variety of problems. Besides the basic results on the structure of the spectrum and the eigenfunction expansion of regular and singular Sturm-Liouville problems, it is in this domain that one-dimensional quantum scattering theory, inverse spectral problems, and the surprising connections of the theory with nonlinear ...

In mathematics and its applications, classical Sturm–Liouville theory is the theory of real second-order linear ordinary differential equations of the form:  $(py')' + qy = \lambda wy$ , for given coefficient functions  $p(x)$ ,  $q(x)$ , and  $w(x) > 0$  and an unknown function  $y$  of the free variable  $x$ . The function  $w(x)$ , sometimes denoted  $r(x)$ , is called the weight or density function.

In Sturm-Liouville theory, we say that the multiplicity of an eigenvalue of a Sturm-Liouville problem  $L[y] = r(x)y'' + (q(x) + \lambda r(x))y = 0$   $y(0) = 0$   $y(1) = 0$  is  $m$  if there are exactly  $m$  linearly independent solutions for that value of  $\lambda$ . Theorem 12.7. The eigenvalues of a Sturm-Liouville problem are all of multiplicity one. Moreover, the

A Sturm-Liouville equation is a second order linear differential equation that can be written in the form  $(p(x)y')' + (q(x) + \lambda r(x))y = 0$ . Such an equation is said to be in Sturm-Liouville form. Here  $p, q$  and  $r$  are specific functions, and  $\lambda$  is a parameter. Because  $\lambda$  is a parameter, it is frequently replaced by other variables or expressions.
