frequency to the motor. Motor speed (rpm) is dependent upon frequency.

Varying the frequency output of VFD controls speed: Speed (rpm) =

frequency (hertz) x 120 / no. of poles

Example: 2-pole motor at different

frequencies 3600 rpm = 60 hertz x 120

$3600 \text{ rpm} / 2 = 3000 \text{ rpm}$
 $3000 \text{ rpm} = 50 \text{ hertz} \times 120 / 2 = 3000 \text{ rpm}$
 $2400 \text{ rpm} = 40 \text{ hertz} \times 120 / 2 = 2400 \text{ rpm}$

max then any value between these limits can be used. If $2L_{min} > L_{max}$ then the variable frequency drive cannot operate with this length of cable and a higher rated variable frequency drive must be used.

Consideration must be given to the high frequency losses in the chokes.
